Nightfall  
protocols

— **4** —

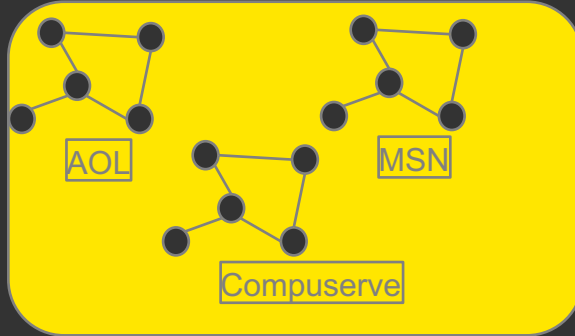

Architecture  
detailed

— **5** —

What  
next?

# Blockchain development is analogous to the development of the internet

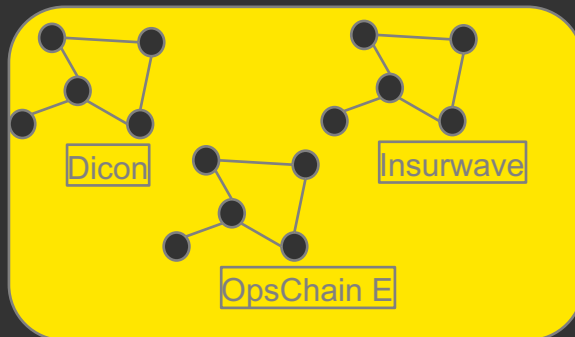

**Yesterday:** multiple independent and 'owned' networks brought some benefits

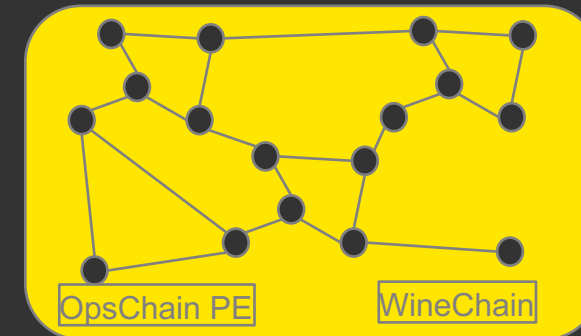

**Today:** frictionless communication via the internet supports e-commerce transactions

**Today:** multiple independent private blockchains bring some benefits

**Tomorrow:** frictionless value exchanges via public blockchain ARE the e-commerce transactions

# What is Nightfall?

---

Public blockchain is great...

...but transaction data is public

# What is Nightfall?

---

Businesses need transaction privacy

**Nightfall** enables privacy

# What is Nightfall?

---

**Nightfall** enables transfer of *fungible* and *non-fungible* tokens between parties such that:

- the value/token id of the token remains **confidential**
- the recipient remains **anonymous**

# What is Nightfall?

---

- ▶ Open source
- ▶ Public domain
- ▶ Ideas & contributions welcome
- ▶ See [github.com/EYBlockchain/nightfall](https://github.com/EYBlockchain/nightfall)

# What is Nightfall?

---

## Nightfall includes...

- ▶ UI
- ▶ APIs
- ▶ Smart Contract Templates
  - ▶ Shield contracts
  - ▶ zk-SNARK verifier contracts
  - ▶ ERC contracts
- ▶ zk-SNARK generator (via ZoKrates)
- ▶ DB's for private data management
- ▶ Private messaging

# What is Nightfall?

---

Nightfall can be subdivided in to 6 sub-protocols

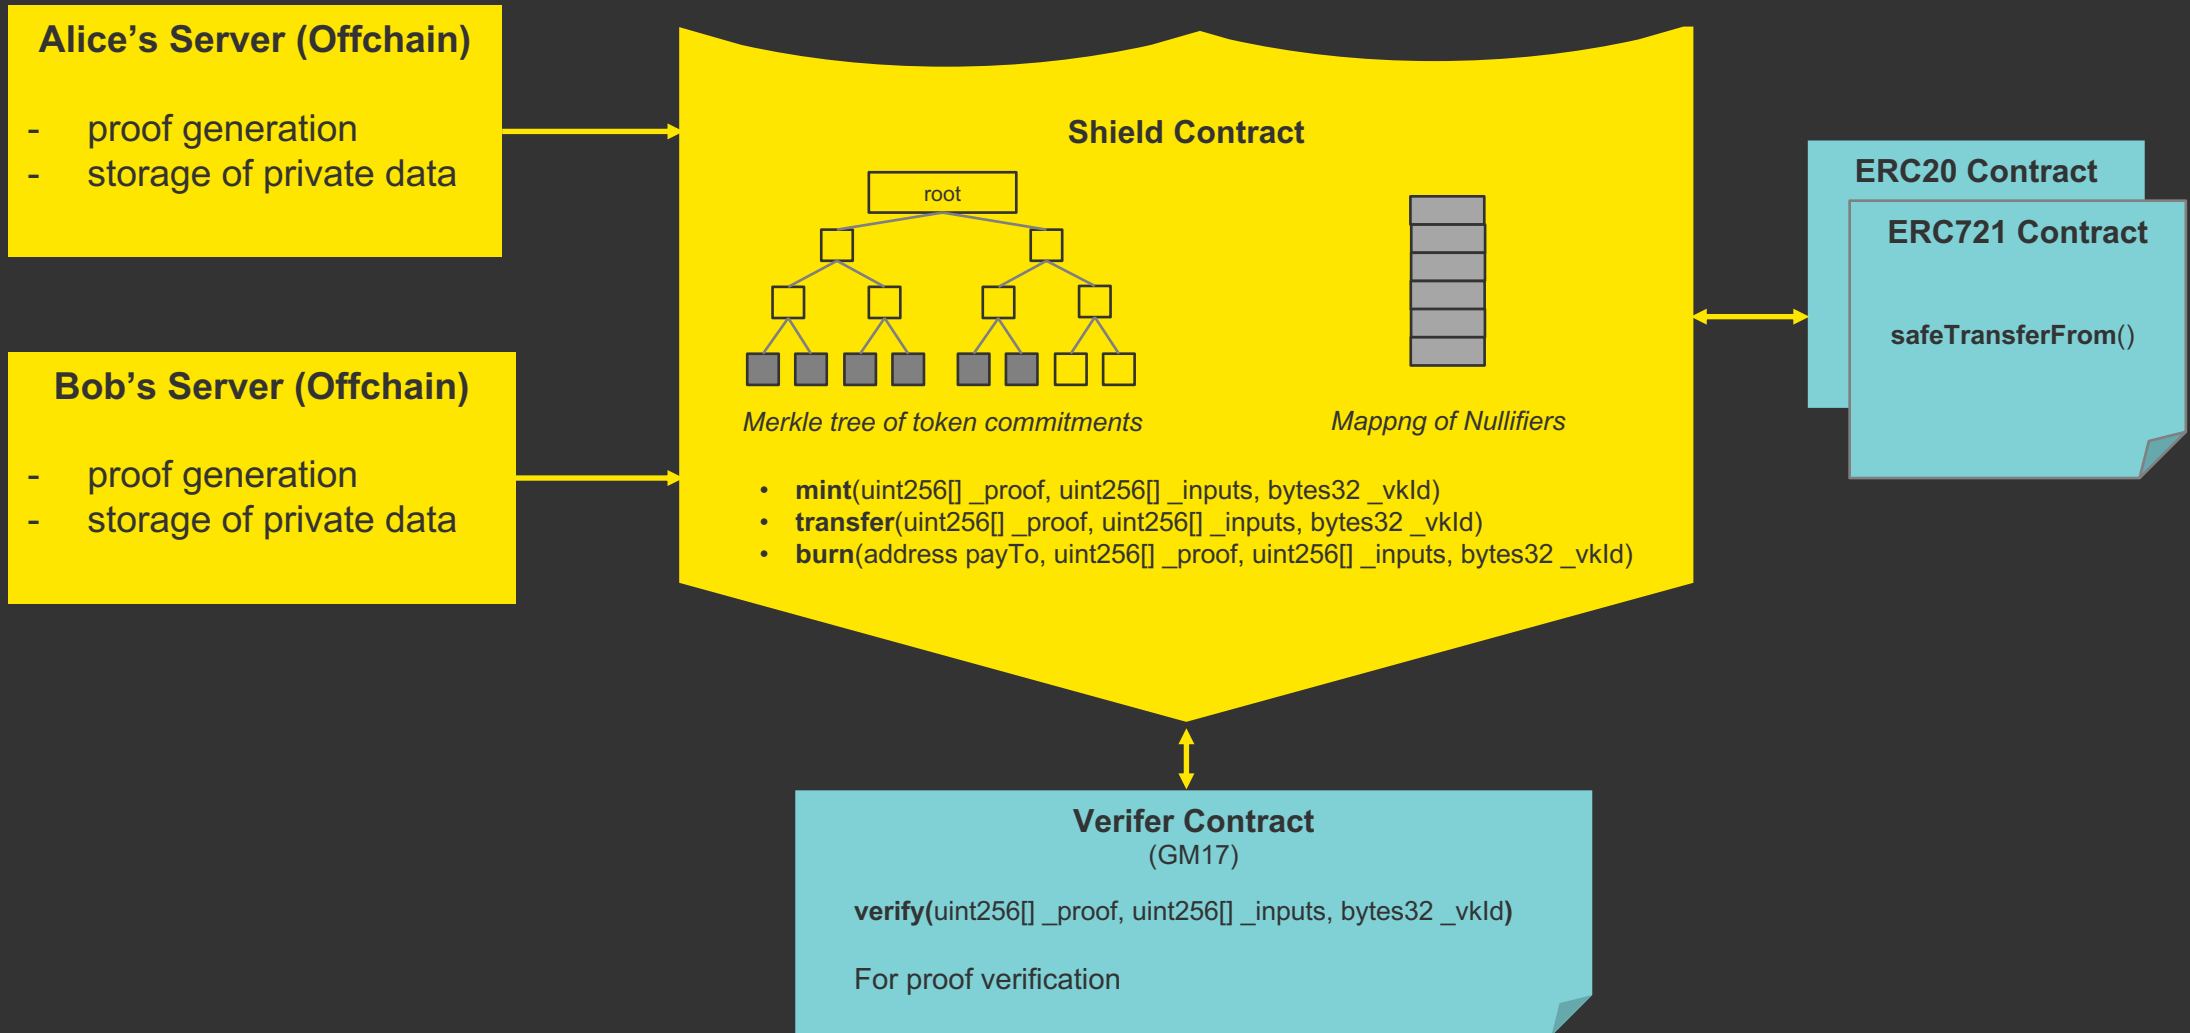

ERC-20 Token Commitments:

- ▶ **Mint**
- ▶ **Transfer**
- ▶ **Burn**

ERC-721 Token Commitments:

- ▶ **Mint**
- ▶ **Transfer**
- ▶ **Burn**

# High Level Architecture

# ERC-721 shielding

## ERC-721 Contract

"Alice owns a **token**,  $T$ "

"Shield Contract  
given custody of  $T$ "

"Bob owns  $T$ "

## Shield Contract

"Alice owns a new **commitment**  
(representing ownership of  $T$ )"

"? owns ?"

"? owns ?"

"? owns ?"

Mint

Transfer

Transfer

Transfer

Burn

# ERC-20 shielding

## ERC-20 Contract

"Alice owns value,  $V$ "

"Shield Contract given custody of  $V$ "

"Bob owns value,  $W$ "

Mint

Burn

## Shield Contract

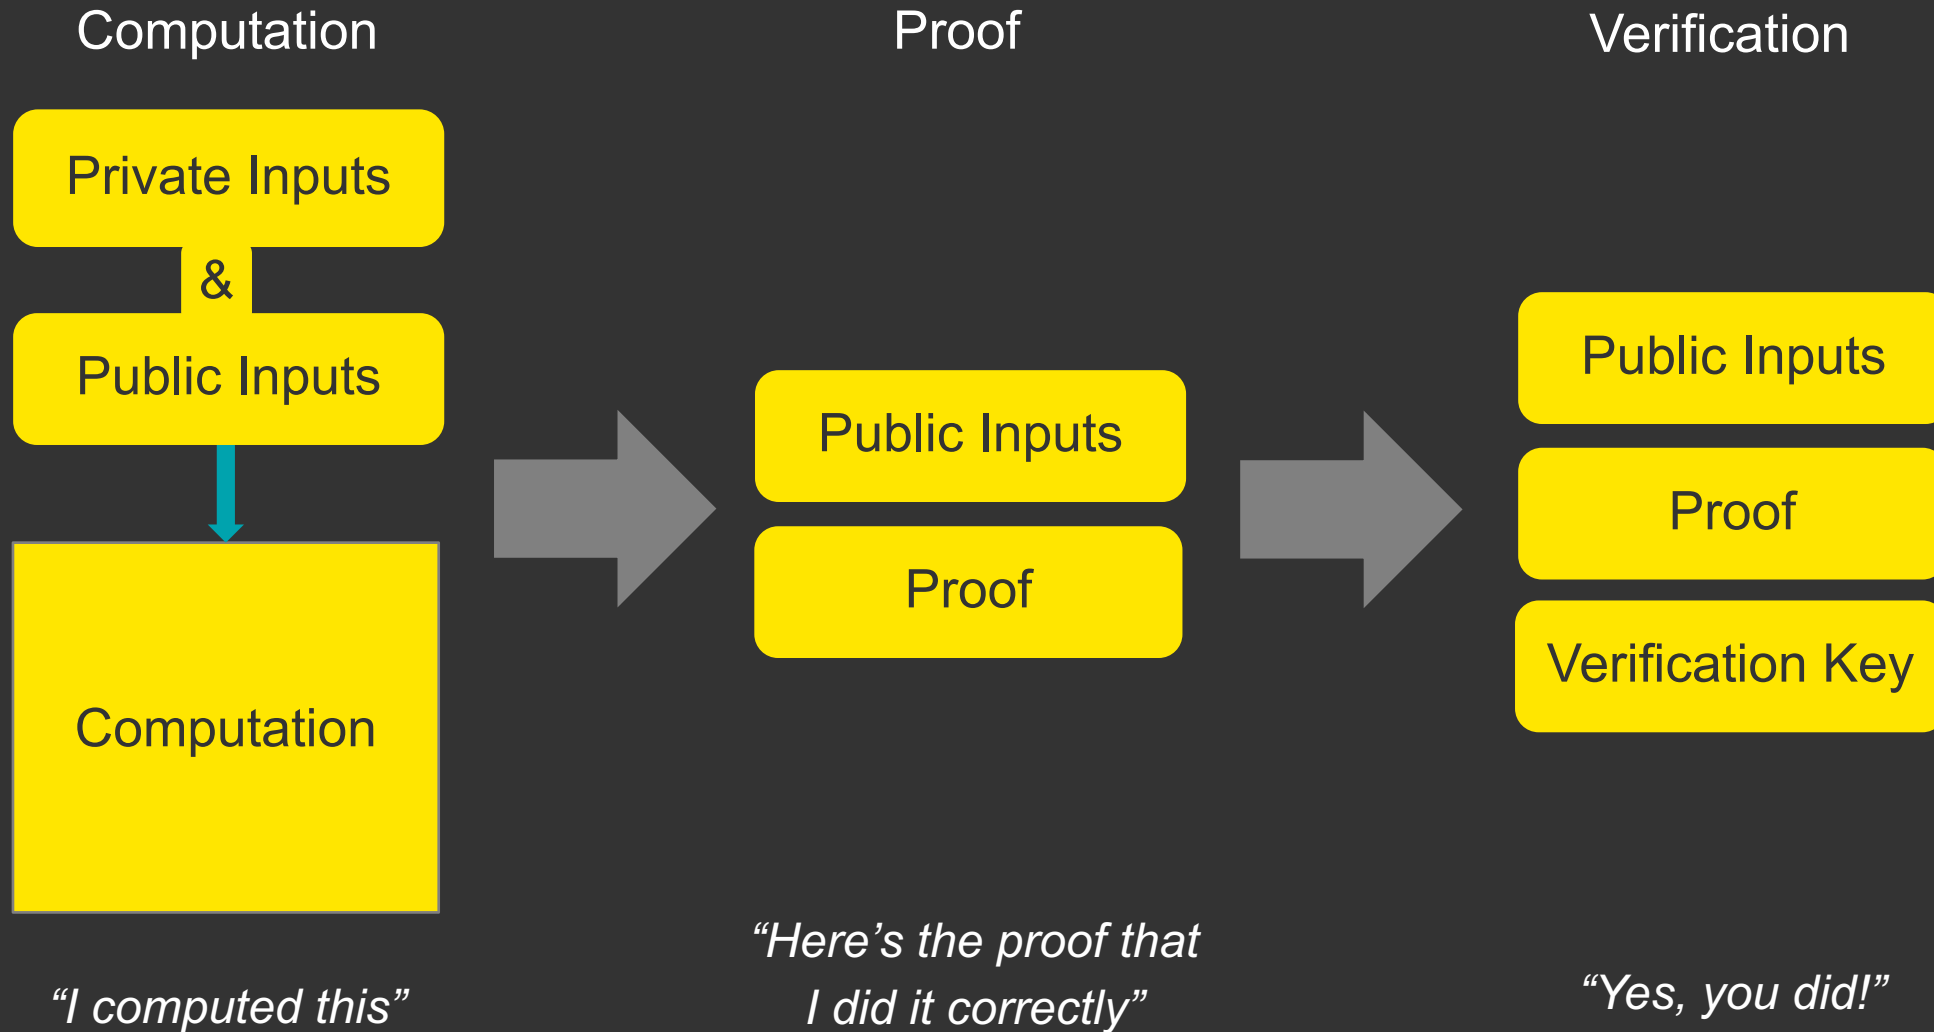

"Alice owns a new **commitment** (representing ownership of  $V$ )"

"? owns ?"

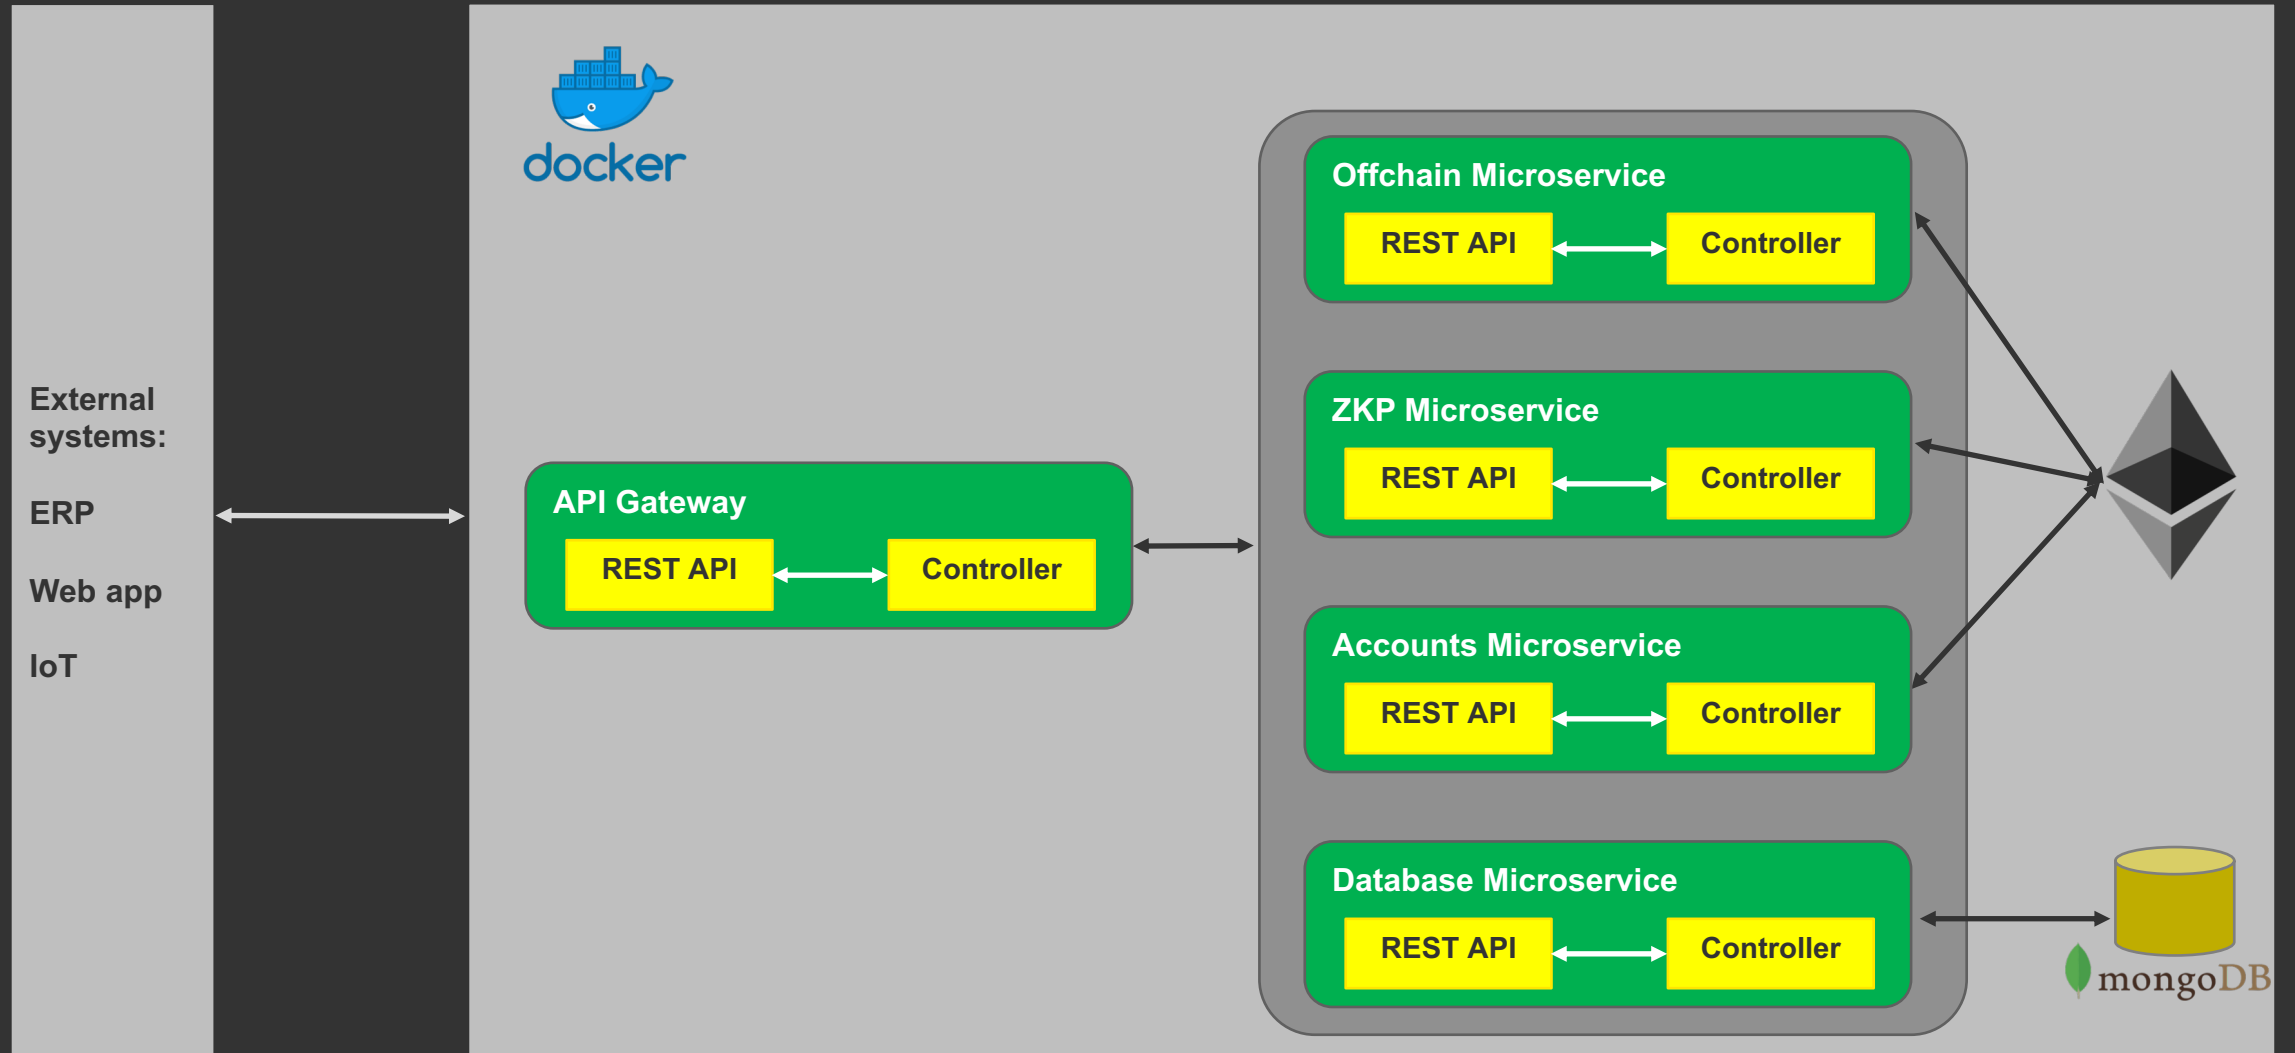

"? owns ?"

"? owns ?"

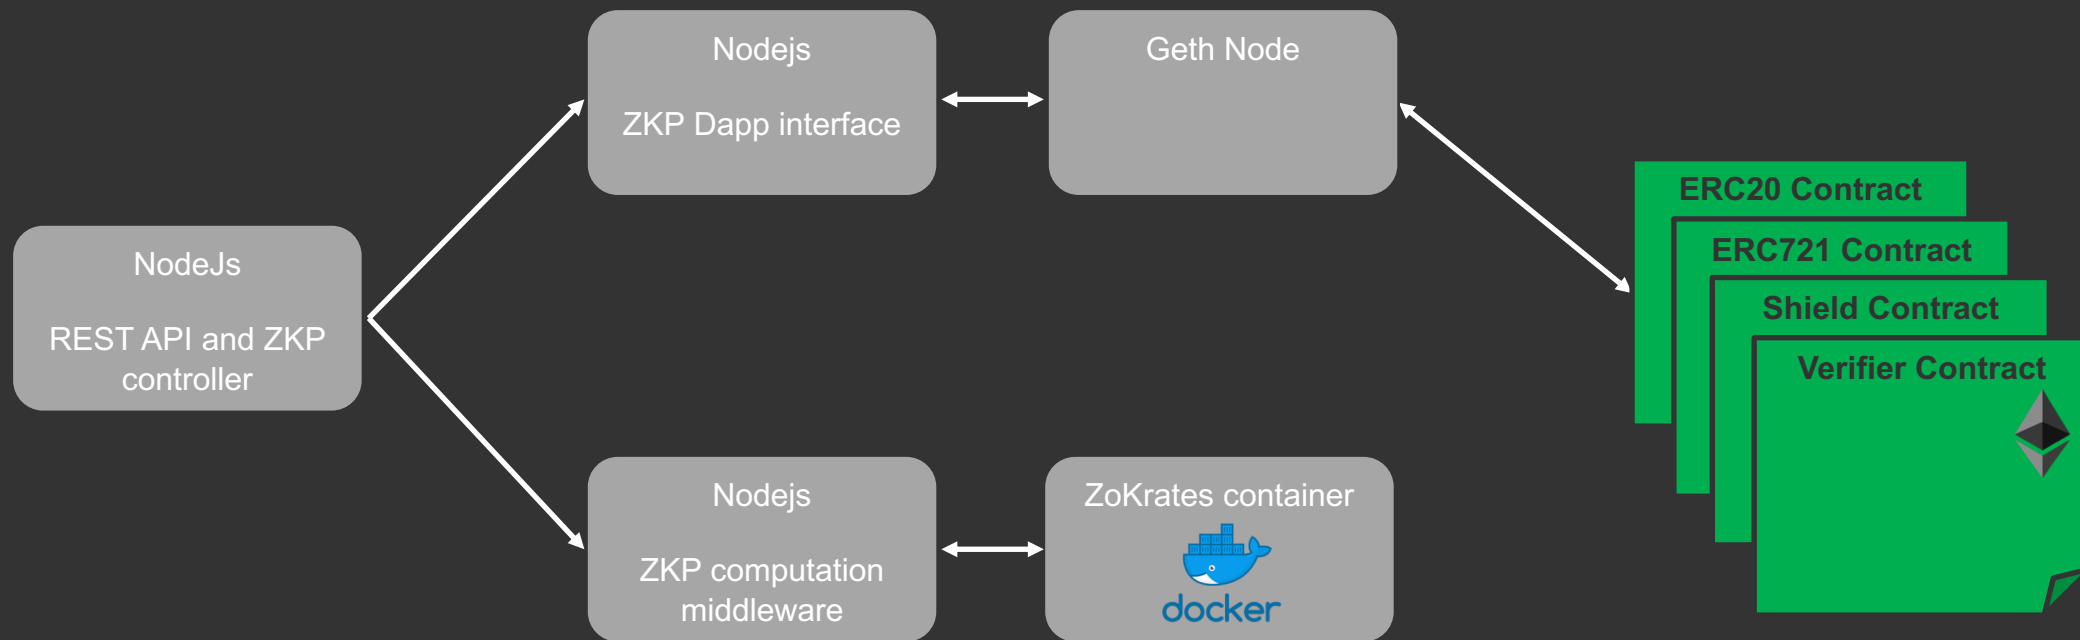

# zk-SNARKs

# Architecture

# ZKP Microservice

# What next?

Contributions welcome!

---

- ▶ More developer tools
  - ▶ Requests welcome!
- ▶ Reduce the cost of private transactions
  - ▶ Batching zk-SNARKs
  - ▶ Smart contract logic
  - ▶ Verification scheme
- ▶ Anonymity of the transactor (token sender)
  - ▶ Transaction relayers
- ▶ zk-SNARK circuit efficiency
- ▶ One Shield Contract
  - ▶ For all ERC-20 / ERC-721 tokens
- ▶ Setup - trusted / trustless schemes?

# Batching proofs

---

**Performing ZKP-based private transactions is costly  
as it requires on chain verification of ZKP**

**For enhancing adoption, we need to improve performance**

**We've developed a prototype for batching proofs and  
are working on integrating into Nightfall**

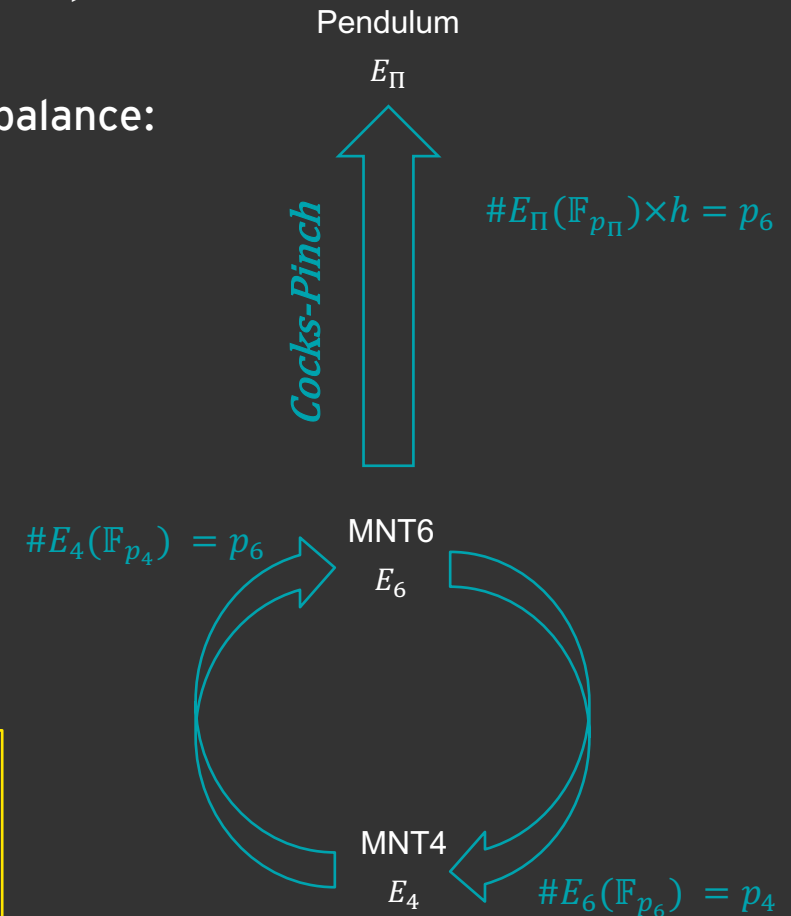

# How to batch proofs ?

The most generic way to batch different zero-knowledge proofs relies on recursive proof composition via pairing-friendly cycles of elliptic curves

As of today the existing solutions do not offer an optimal security/performance balance:

Cycle	Security vs. speed <sup>(1,2)</sup>	Recursion depth
MNT4 / MNT6	Security <input type="radio"/> Speed <input type="radio"/>	$+\infty$
MNT4753 / MNT6753 (Coda)	Security <input type="radio"/> Speed <input type="radio"/>	$+\infty$
BLS12_377 / SW6 (Zexe)	Security <input type="radio"/> Speed <input type="radio"/>	1

Leveraging on these approaches, we designed the **Pendulum protocol** that can achieve both secure and fast aggregation

# General overview of the batching protocol

Single proof that will be verified on chain using the custom curve  
The verification will trigger all the individual blockchain transfer

Blockchain  
Off chain

Proof transposed on a custom curve

$\pi_{pendulum}$

Proof generated on MNT<sub>6</sub> curve

$\pi_{batch,A+B+\dots+Y+Z}$

Proofs generated on MNT<sub>4</sub> curve

$\pi_{batch,\dots}\pi_{batch,\dots}$

Proofs generated on MNT<sub>4</sub> curve

$\pi_{batch,A+B+C+D}$

Proofs generated on MNT<sub>6</sub> curve

$\pi_{batch,A+B}$

$\pi_{batch,C+D}$

$\pi_{batch,Y+Z}$

Proofs generated on MNT<sub>4</sub> curve

$\pi_A$

$\pi_B$

$\pi_C$

$\pi_D$

$\pi_Y$

$\pi_Z$

Multiple batching of proofs following the Pendulum protocol (alternation between MNT<sub>4</sub> / MNT<sub>6</sub> curves and final transposition on a custom curve embedding MNT<sub>6</sub>)

Creation of all the individual ZKP that represents transfer of ownership based on Nightfall protocol

# Code released

---

## ZoKrates

- Exposing off chain proof verification on ZoKrates
- Generate unitary proofs targeting MNT4/MNT6 curves
- Batching MNT4/MNT6 proofs on ZoKrates

## libsnark

- Expose the verification circuit gadget to build a proof of proof

## libff

- Support MNT4753, MNT6753, BLS12-381, BLS12-377, SW6, SW6-BIS, Pendulum curves

**EY** | Assurance | Tax | Transactions | Advisory

**About EY**

EY is a global leader in assurance, tax, transaction and advisory services. The insights and quality services we deliver help build trust and confidence in the capital markets and in economies the world over. We develop outstanding leaders who team to deliver on our promises to all of our stakeholders. In so doing, we play a critical role in building a better working world for our people, for our clients and for our communities.

EY refers to the global organization, and may refer to one or more, of the member firms of Ernst & Young Global Limited, each of which is a separate legal entity. Ernst & Young Global Limited, a UK company limited by guarantee, does not provide services to clients. For more information about our organization, please visit [ey.com](http://ey.com).
